

DentalCare Pro - Troubleshooting Guide

Self-Service Diagnostics, Network Resolution & Fast Fixes

1. Fast Diagnostic Tool

Before calling support, open the Support folder and run **Diagnostic-Tool.exe**.
It performs an automated 10-second inspection of PostgreSQL service, TCP port 5432, RAM, disk space, and API responsiveness.

2. Common Issues & Fast Resolutions

Symptom	Root Cause	Recommended Resolution
Database connection error on startup	PostgreSQL service stopped or not listening on port 5432	Run Support/Database-Troubleshooter.bat. Start PostgreSQL service in Windows Services (services.msc).
Operatory PC cannot connect to Server	Windows Defender Firewall blocking port 8000 or 5432	Add an Inbound Firewall Rule for TCP port 8000 and 5432 on the Server PC. Ensure both PCs are on the same clinic Wi-Fi.
Thermal printer outputs blank receipt	Thermal paper roll inserted upside down or out of paper	Flip thermal paper roll so heat-sensitive side contacts print head. Check printer USB cable connection.
Application launches to white screen	Backend API supervisor starting or port conflict	Wait 5 seconds and press F5 to reload. Check %LOCALAPPDATA%\DentalCarePro\logs\app.log for port errors.

3. Log File Locations (For Support Assistance)

- All diagnostic logs are stored locally for privacy compliance:
- %LOCALAPPDATA%\DentalCarePro\logs\app.log (Desktop application shell events)
 - %LOCALAPPDATA%\DentalCarePro\logs\backend.log (API server & database transactions)
 - %LOCALAPPDATA%\DentalCarePro\logs\backup.log (Daily backup snapshot history)
